INFORMATICS ENGINEERING — INSTITUT TEKNOLOGI SUMATERA

Ahmad Ali Mukti

Software Engineer | Web & Mobile Developer

I am an Informatics Engineering student at **Institut Teknologi Sumatera**, passionate about backend systems and **IoT**. I build end-to-end platforms web, mobile with **Kotlin and Flutter**, smart farming, and GIS powered by Laravel and MQTT, and I'm now exploring **Artificial Intelligence** for what's next. With active experience in mentoring and organizational leadership, I thrive in **fast-paced, collaborative environments**.

ITERAHERO App

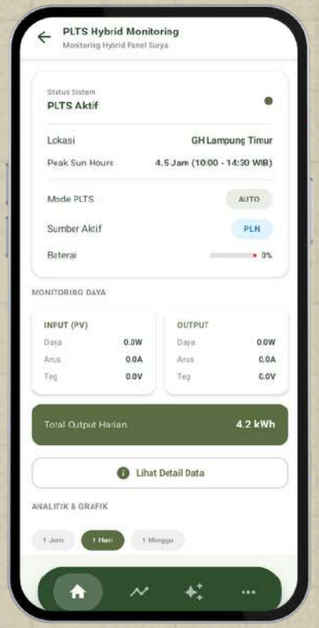

MBKM Research Program | Team Lead | Backend Developer | MQTT Data Flow

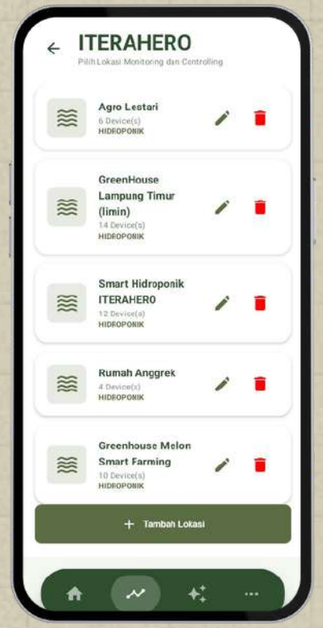

As the Informatics Team Lead for the ITERAHERO MBKM group research program, I developed a centralized smart greenhouse application (using Laravel, Kotlin, and MQTT) that integrated hardware subsystems from the electrical, biosystems, and automation engineering teams. My infrastructure successfully unified isolated data streams ranging from sensor telemetry to AI plant classification into one cohesive, real-time monitoring platform for the entire cross-functional team. Through this project, I learned how to manage complex cross-disciplinary technical communication and architect scalable data flows to handle diverse IoT hardware.

SIMTA — Sistem Tugas Akhir Prodi Matematika

Paid Project | Frontend Developer | Team of 4

Commissioned by the Mathematics department, I served as the Frontend Developer in a four-person team to build SIMTA using Laravel Blade. I engineered dynamic interfaces to handle complex workflows like multi-level document approvals, rubric-driven exams scoring, and a context-switching dashboard for professors. Currently at 90% completion and undergoing final department review, the platform is designed to digitize the entire academic lifecycle from initial proposals to comprehensive exam.

Website PPLK ITERA 2025

Campus Committee | Staff Backend Developer

As a backend staff member, I co-developed the website for PPLK 2025, ITERA's annual student orientation program. Using Laravel, I built the server-side
logic to securely manage user authentication, participant data handling, and dynamic content publishing. The platform successfully served as the central hub for over 5,000 users to seamlessly register and track their daily agenda

Drone Flight Path Reconstruction

Fullstack Developer

Internship @ PT Great Giant Pineapple

During my internship at PT Great Giant Pineapple, I built the flight-path reconstruction feature for the company's drone monitoring platform. It reads SRT telemetry from flight recordings, rebuilds the route on an interactive map, and reports the covered distance and surveyed area, enabling the plantation team to verify coverage without replaying footage. I engineered the backend microservice using Flask to process geospatial data alongside the existing Laravel platform.

2025

Nuve — AI Fashion Recommendation Platform

Backend Developer

As a Backend Developer for the Nuve AI fashion platform, I co-engineered the server-side architecture using Express.js and Firebase. I designed the catalog database and built robust RESTful APIs to connect user inputs directly with the AI recommendation engine. To streamline product management, I also developed secure administrative CRUD endpoints for the CMS.
